Outline

1. The ℓ_2 Support Vector Machines

2. Domain Adaptation Support Vector Machines

3. Density Estimation (Code)

1. The ℓ_2 Support Vector Machines

1 The ℓ_2 Support Vector Machine [20pts]

In class, we discussed that if our data is not linearly separable, then we need to modify our optimization problem to include slack variables. The formulation that was used is known as the ℓ_1 -norm soft margin SVM. Now consider the formulation of the ℓ_2 -norm soft margin SVM, which squares the slack variables within the sum. Notice that non-negativity of the slack variables has been removed.

$$\begin{aligned} \arg \min_{\mathbf{w}, b, \xi} & \frac{1}{2} \|\mathbf{w}\|^2 + \frac{C}{2} \sum_{i=1}^n \xi_i^2 \\ \text{s.t. } & y_i(\mathbf{w}^T \mathbf{x}_i + b) \geq 1 - \xi_i \quad \forall i \in [n] \end{aligned}$$

Derive the dual form expression along with any constraints. Work must be shown. *Hints:* Refer to the methodology that was used in class to derive the dual form. The solution is given by:

$$\begin{aligned} \arg \max_{\alpha} & \sum_{i=1}^n \alpha_i - \frac{1}{2} \sum_{i=1}^n \sum_{j=1}^n \alpha_i \alpha_j y_i y_j \mathbf{x}_i^T \mathbf{x}_j - \frac{1}{2C} \sum_{i=1}^n \alpha_i^2 \\ \text{s.t. } & \alpha_i \geq 0 \quad \forall i \in [n] \quad \text{and} \quad \sum_{i=1}^n \alpha_i y_i = 0 \end{aligned}$$

Constraints

0.

$$\varepsilon_i \geq 0, -\varepsilon_i \leq 0$$

$$0 \leq \alpha_i \leq C$$

1.

$$y_i(\omega^T x_i + b) \geq 1 - \varepsilon_i$$

2.

$$y_i(\omega^T x_i + b) - 1 + \varepsilon_i \geq 0$$

Lagrangian

3.

$$L(\omega, b, \alpha, \varepsilon) = \frac{1}{2} \|\omega\|_2^2 + \frac{C}{2} \sum_{i=1}^n [\varepsilon_i^2] - \sum_{i=1}^n \alpha_i [y_i(\omega^T x_i + b) - 1 + \varepsilon_i]$$

Derivative

4.

$$\frac{dL}{d\omega} = w + 0 - \sum_{i=1}^n \alpha_i y_i x_i = 0 \rightarrow \omega = \sum_{i=1}^n \alpha_i y_i x_i$$

5.

$$\frac{dL}{db} = 0 + 0 - \sum_{i=1}^n \alpha_i y_i = 0 \rightarrow 0 = \sum_{i=1}^n \alpha_i y_i$$

6.

$$\frac{dL}{d\varepsilon} = 0 + C \sum_{i=1}^n \varepsilon_i - \sum_{i=1}^n \alpha_i = 0 \rightarrow \frac{1}{C} \sum_{i=1}^n \alpha_i = \sum_{i=1}^n \varepsilon_i$$

Back to Lagrangian

7.

$$L = \frac{1}{2} \sum_{i=1}^n \sum_{j=1}^n \alpha_i y_i x_i \alpha_j y_j x_j + \frac{C}{2} \sum_{i=1}^n \varepsilon_i^2$$

$$- \sum_{i=1}^n \alpha_i y_i \omega^T x_i - b \sum_{i=1}^n \alpha_i y_i + \sum_{i=1}^n \alpha_i - \sum_{i=1}^n \varepsilon_i$$

8.

$$L = \frac{1}{2} \sum_{i=1}^n \sum_{j=1}^n \alpha_i y_i x_i \alpha_j y_j x_j + \frac{C}{2} \left(\frac{1}{C} \right)^2 \sum_{i=1}^n \alpha_i^2$$

$$- \sum_{i=1}^n \sum_{j=1}^n \alpha_i y_i x_i \alpha_j y_j x_j + \sum_{i=1}^n \alpha_i - \frac{1}{C} \sum_{i=1}^n \alpha_i$$

9.

$$L = \left(1 - \frac{1}{C}\right) \sum_{i=1}^n \alpha_i - \frac{1}{2} \sum_{i=1}^n \sum_{j=1}^n \alpha_i y_i x_i \alpha_j y_j x_j + \left(\frac{1}{2C}\right) \sum_{i=1}^n \alpha_i^2$$

Solution

10.

$$\operatorname{argmax}_{\alpha} \left(1 - \frac{1}{C}\right) \sum_{i=1}^n \alpha_i - \frac{1}{2} \sum_{i=1}^n \sum_{j=1}^n \alpha_i y_i x_i \alpha_j y_j x_j + \left(\frac{1}{2C}\right) \sum_{i=1}^n \alpha_i^2$$

s.t.

$$0 \leq \alpha_i \leq C$$

$$\sum_{i=1}^n \alpha_i y_i = 0$$

2. Domain Adaptation Support Vector Machines

2 Domain Adaptation Support Vector Machines [20pts]

We now look at a different type of SVM that is designed for domain adaptation and optimizes the hyperplanes given by \mathbf{w}_S (source hyperplane) before optimizing \mathbf{w}_T (target hyperplane). The process begins by training a support vector machine on source data then once data from the target are available, train a new SVM using the hyperplane from the first SVM and the data from the target to solve for a new “domain adaptation” SVM.

The primal optimization problem is given by

$$\begin{aligned} \arg \min_{\mathbf{w}_T, \xi} \quad & \frac{1}{2} \|\mathbf{w}_T\|^2 + C \sum_{i=1}^n \xi_i - B \mathbf{w}_T^T \mathbf{w}_S \\ \text{s.t.} \quad & y_i (\mathbf{w}_T^T \mathbf{x}_i + b) \geq 1 - \xi_i \quad \forall i \in \{1, \dots, n\} \\ & \xi_i \geq 0 \quad \forall i \in \{1, \dots, n\} \end{aligned}$$

where \mathbf{w}_S is hyperplane trained on the source data (*assumed to be known*), \mathbf{w}_T is hyperplane for the target, $y_i \in \{\pm 1\}$ is the label for instance \mathbf{x}_i , C & B are regularization parameters defined by the user and ξ_i is a slack variable for instance \mathbf{x}_i . The problem becomes finding a hyperplane, \mathbf{w}_T , that minimizes the above objective function subject to the constraints. Solve/derive the dual optimization problem.

Note: I will give the class the solution to this problem prior to the due date because Problem #3 requires that you implement this algorithm in code.

- sorry no latex : (

Handwritten notes for domain adaptation SVM dual optimization:

Primal Problem:

$$\begin{aligned} \text{arg min}_{\mathbf{w}_T, \xi} \quad & \frac{1}{2} \|\mathbf{w}_T\|^2 + C \sum_{i=1}^n \xi_i - B \mathbf{w}_T^T \mathbf{w}_S \\ \text{s.t.} \quad & y_i (\mathbf{w}_T^T \mathbf{x}_i + b) \geq 1 - \xi_i \\ & \xi_i \geq 0 \end{aligned}$$

Lagrangian Function:

$$L = \frac{1}{2} \|\mathbf{w}\|^2 + C \sum_{i=1}^n \xi_i - B \mathbf{w}_T^T \mathbf{w}_S - \sum_{i=1}^n \alpha_i [y_i (\mathbf{w}_T^T \mathbf{x}_i + b) - 1 + \xi_i] - \sum_{i=1}^n \gamma_i \xi_i$$

Optimality Conditions:

$$\begin{aligned} \frac{\partial L}{\partial \mathbf{w}} &= \mathbf{w} - \sum_{i=1}^n \alpha_i y_i \mathbf{x}_i - B \mathbf{w}_S = 0 \\ \frac{\partial L}{\partial b} &= \sum_{i=1}^n \alpha_i y_i = 0 \\ \frac{\partial L}{\partial \xi} &= C - \alpha_i - \gamma_i = 0 \quad C = \alpha_i + \gamma_i \end{aligned}$$

Annotations:

- α_i = Lagrange Multiplier

$$\begin{aligned}
 L &= \frac{1}{2} \left(\sum_{i=1}^n \alpha_i y_i x_i + B w_s \right) \left(\sum_{j=1}^m \alpha_j y_j x_j + B w_s \right) \\
 &\quad - C \sum_{i=1}^n \alpha_i y_i \left(\sum_{j=1}^m \alpha_j y_j x_j + B w_s \right) \\
 &\quad - \sum_{i=1}^n \alpha_i y_i \left(\sum_{j=1}^m \alpha_j y_j x_j + B w_s \right) \\
 &\quad - \sum_{i=1}^n \alpha_i y_i b + \sum_{i=1}^n \alpha_i - \sum_{i=1}^n \alpha_i \epsilon_i - \sum_{i=1}^n y_i \epsilon_i \\
 \text{Notes:} \\
 \textcircled{1} \quad & \left(\sum_{i=1}^n \alpha_i y_i - \sum_{i=1}^n \alpha_i (\alpha_i + a_i) \right) = 0 \quad \text{KKT condition} \\
 & \quad \alpha_i \epsilon_i = 0 \\
 \textcircled{2} \quad & \sum_{i=1}^n \alpha_i y_i x_i = \sum_{j=1}^m \alpha_j y_j x_j \\
 L &= -\frac{1}{2} \sum_{i=1}^n \sum_{j=1}^m \alpha_i y_i x_i \alpha_j y_j x_j + \sum_{i=1}^n \alpha_i \\
 &\quad + 2 \left(\frac{1}{2} \sum_{i=1}^n \alpha_i y_i x_i \cdot B w_s \right)^2 \\
 &\quad - \sum_{i=1}^n \alpha_i y_i x_i \cdot B w_s - (B w_s)^2 \quad] \text{ since } \sum_{i=1}^n \alpha_i = 0 \\
 &\quad - \sum_{i=1}^n \alpha_i y_i x_i \cdot B w_s \\
 L &= \sum_{i=1}^n \alpha_i \left(1 - y_i x_i \cdot B w_s \right) - \frac{1}{2} \sum_{i=1}^n \sum_{j=1}^m \alpha_i \alpha_j y_i y_j x_i x_j
 \end{aligned}$$

Dual Form

$$\begin{aligned}
 \arg \max_{\alpha_i} \quad & \left\{ \sum_{i=1}^n \alpha_i (1 - B y_i w_s x_i) \right. \\
 & \left. - \frac{1}{2} \sum_{i=1}^n \sum_{j=1}^m \alpha_i \alpha_j y_i y_j x_i^T x_j \right\} \\
 \text{s.t.} \quad & \sum_{i=1}^n \alpha_i y_i = 0 \\
 & 0 \leq \alpha_i \leq C
 \end{aligned}$$

3. Density Estimation (Code)

3 Density Estimation (Code) [20pts]

Implement the domain adaptation SVM from Problem #2. A data set for the source and target domains (both training and testing) have been uploaded to D2L. There are several ways to implement this algorithm. If I were doing this for an assignment, I would implement the SVM (both the domain adaptation SVM and normal SVM) directly using quadratic programming. You do not need to build the classifier (i.e., solve for the bias term); however, you will need to find w_T and w_S . To find the weight vectors, you will need to solve a quadratic programming problem and look through the documentation to learn how to solve this optimization task. The following Python packages are recommended:

- CVXOPT (<https://cvxopt.org/>)
- PyCVX (<https://www.cvxpy.org/install/>)

Note: Your solution can use any of the packages above.
